## Poll Methodology

From January 10-19, 2020, The Texas Lyceum conducted a 1000 person telephone survey of adult citizens from the state of Texas. The survey utilized a stratified probability sample design, with respondents being randomly selected at the level of the household and questioned by live interviewers. The survey also employed a randomized cell phone supplement, with 60 percent of completed interviews being conducted among cell phone only or cell phone dominant households. A Spanish-language instrument was developed and bilingual interviewers offered respondents a chance to participate in English or Spanish. On average, respondents completed the interview in 15 minutes. To ensure an appropriate sub-sample of unregistered citizens, a supplement of 200 interviews among Texas adults confirmed as unregistered was completed online. This yields a total statewide sample of 1,200 adults, 920 of whom are registered voters according to self-reports. The final data set is weighted by race/ethnicity, age and gender to achieve representativeness as defined by the Texas Department State Health Services 2019 population projections for non-election specific items. For items covering voting preferences in the 2020 Texas primary and general elections, the responses of registered voters are weighted by race/ethnicity, age and gender to achieve representativeness of the state’s registered voter population. The overall margin of error for the poll is +/- 2.83 percentage points for the full sample and +/-3.23 percentage points for registered voters, with a larger margin of error for sub-samples.
